Aufgabe3_test

November 21, 2020

1 Aufgabe 3: Data Preparation und Modeling

1.1 TODO:

- Anomalien bereinigen
- Feature Engineering
  - Unnötige Spalten (siehe Aufg. 2) entfernen
  - One-Hot Encoding einiger Eigenschaften
-

[11]:
```
import pandas as pd
import matplotlib.pyplot as plt
import math
import seaborn as sb
from sklearn.linear_model import LinearRegression
from sklearn.linear_model import LogisticRegression, SGDClassifier
from sklearn.model_selection import train_test_split
```

[3]:
```
dataset = pd.read_csv('./DatenAusgegeben1.0.csv', delimiter=';', encoding =␣
↪'cp852')
dataset
```

[3]:

1999          2138  152400

[2000 rows x 28 columns]
```

1.2 Unnötige Spalten entfernen

Zu entfernen sind:
Siehe Aufg. 2. Untersuchung auf einen Zusammenhang zwischen Preis und Verkaufszeitpunkt: - Verkaufsjahr - Verkaufsmonat

(Da Gesamtwohnfläche zusammengesetzt aus erster Stock und zweiter Stock ist: - Erster Stock in qm - Zweiter Stock in qm #TODO: Prüfen ob nicht rauszunehmen)

Siehe Aufg. 2. Untersuchung des Datensatzes auf vernachlässigbare Hauseigenschaften (Spalten):

- Pool - Küchen - Klimaanlage - Heizung

[4]:
```
df_keinunnoetig = dataset.drop(['Verkaufsjahr', 'Verkaufsmonat', 'Erster Stock␣
↪in qm', 'Zweiter Stock in qm', 'Pool', 'Küchen', 'Klimaanlage', 'Heizung'],␣
↪axis = 1)
```

1.3 Anomalien bereinigen

Nun sollen Anomalien in dem Datensatz gefunden und bereinigt werden. Hierbei wird der Interquartilsabstand verwendet um Ausreißer zu finden.
(https://en.wikipedia.org/wiki/Interquartile_range)

Hierbei sollen ausschließlich numerische Werte, also keine Werte einer ordinalen Skala betrachtet werden. (`columns_filtered`)

[5]:
```
columns = ['Grundstück in qm', 'Zustand', 'Gebaut',
           'Renoviert', 'Zustand Fassade', 'Kellerflche in qm',
           'Wohnflche in qm', 'Schlafzimmer', 'Küchenqualitt',
           'Rume', 'Garagenkapazitt', 'Preis']

columns_filtered = ['Grundstück in qm', 'Kellerflche in qm', 'Wohnflche in qm',
           'Schlafzimmer', 'Gebaut', 'Rume', 'Garagenkapazitt', 'Preis']

Q1 = df_keinunnoetig[columns_filtered].quantile(0.25)
Q3 = df_keinunnoetig[columns_filtered].quantile(0.75)
IQR = Q3 - Q1

df_anomalienbereinigen = df_keinunnoetig[~((df_keinunnoetig[columns_filtered] <␣
↪(Q1 - 1.5 * IQR)) |(dataset[columns_filtered] > (Q3 + 1.5 * IQR))).
↪any(axis=1)]
```

1.4 Verifikation der Bereinigung

Nun soll verifiziert werden, ob die Bereinigung auf Anomalien erfolgreich gewesen ist. Hierzu können die untenstehenden Boxplots mit denen aus **Aufg. 2, Finden von Anomalien** verglichen werden.

[6]:
```
fig, axes = plt.subplots(4, 5, figsize = (10, 15))
i = 0
plt.tight_layout(pad = 2)
for column in columns:
  chosenax = axes[math.floor(i / 5)][i % 5]
  chosenax.set_title(column)
  sb.boxplot(data = df_anomalienbereinigen[[column]], ax = chosenax)
  i = i + 1
plt.show()
```
